

Aruspix Development Set Up

May 25, 2011

1 Introduction

Aruspix uses four libraries that have to be installed on your system for it to compile. They are the following:

- wxWidgets 2.8.7 (<http://www.wxwidgets.org/>)
- IM 3.1 for VC 6 (<http://www.tecgraf.puc-rio.br/im/>)
- Torch 2.0 (<http://www.torch.ch/>)
- TinyXML (<http://www.grinninglizard.com/tinyxml/index.html/>)

This document will outline the steps involved in compiling these libraries for Windows XP and MacOS X operating systems.

For MacOS X, TinyXML is include in the project and does not need to be installed and compiled separately.

2 Windows XP Set Up (Using Microsoft Visual C++ 6)

Note: Microsoft Visual C++ 6 has been the main Windows development tool up to date. However the project has also been compiled and run successfully using Microsoft Visual C++ 8 following the same set up guide. Some of the project properties may need to be adjusted as they are not always maintained when upgrading a project. Refer to the trouble shooting section if problems arise.

2.1 wxWidgets

To compile wxWidgets open

```
wxWidgets-2.8.7\build\msw\wx.dsw
```

using VC 6. Select Batch Build from the Build drop down menu. Now select the following three configurations from each section and build:

- Win32 DLL Debug
- Win32 Release
- Win32 Debug

2.2 IM Library

This library is available pre-compiled. Just ensure that the library you've downloaded has a file structure that matches the following example:

```
\imlib
  \include : should contain all source files
  \lib : should contain all library files
```

2.3 TinyXML

To compile this library simply open

```
tinymce\xml\tinymce.dsw
```

with VC 6. Select Batch Build from the Build drop down menu and the build the whole project. Now ensure that the file structure matches the following example:

```
\tinymce : Contains the tinymce source files.  
    \Debug : Contains the debug tinymce lib file.  
    \Release : Contains the release tinymce lib file.
```

<http://stackoverflow.com/questions/5476840/can-you-explain-these-disturbing-anomalies-of-md5-and-modulo>

2.4 Torch

After downloading Torch, follow the instructions provided on the Torch website for compiling the library on Windows. Be sure to name the project "Torch3".

http://www.torch.ch/matos/w_install.pdf

After compilation, make sure the Torch library folder has a file structure that matches the following example:

```
\Torch3  
    \Debug : Contains the Torch3.lib (Debug) file  
    \Release : Contains the Torch3.lib (Release) file  
    \src : Contains the Torch source files
```

Next you need to add the following environment variable to your system:

- TORCH : Path to the Torch folder.

To do this, right click on the My Computer icon and select properties. Then select Environment Variables from the Advanced tab. Add the variable to the "User variables" section.

Now open

```
aruspix\win32\torch.dsw
```

with VC 6. Select batch build and build all the project configurations.

2.5 Aruspix

To compile Aruspix the following environment variables must added to operating system's configuration:

- IMLIB : Path of the IMLib folder
- TINYXML : Path of the TinyXML folder
- WXWIN : Path of the wxWidgets folder
- WXWIN_VERSION : wxWidgets version number (format ex. for 2.8.7: 28)

Now simply open aruspix/win32/Aruspix.dsw and you should be ready to compile Aruspix.

2.6 Troubleshooting

If linking errors occur at any stage in the setup it is likely due to the code generation settings of the projects. To fix the problem ensure that all the libraries and projects are compiled using the same code generation settings which can be found in:

```
project settings/properties -> C/C++ -> Code Generation -> Use run-time library
```

We have been using "Multithreaded DLL" for release versions and "Multithreaded Debug DLL" for debug versions.

3 Mac OS 10 Set Up (Using Xcode)

3.1 wxWidgets Compilation

1. Create two directories within the wxWidgets directory: osx-static, osx-static-debug.
2. In the osx-static-debug directory run the following commands to compile for debug mode:

```
../configure --disable-shared --enable-debug --with-libjpeg=builtin --with-libpng=builtin
--with-macosx-sdk=/Developer/SDKs/MacOSX10.5.sdk
make clean (if necessary)
make
```

3. In the osx-static directory run the following commands to compile for release mode:

```
../configure --disable-shared --enable-universal_binary --with-libjpeg=builtin
--with-libpng=builtin --with-macosx-sdk=/Developer/SDKs/MacOSX10.5.sdk
make clean (if necessary)
make
```

4. On OSX 10.6 you may need to add beforehand:

```
export arch_flags="-arch i386"
../configure CFLAGS="$arch_flags" CXXFLAGS="$arch_flags" \
CPPFLAGS="$arch_flags" LDFLAGS="$arch_flags" ...
```

if you get an error while compiling Wx.

3.2 Setting Aruspix Environment Variables

In the aruspix/osx directory you will find an XML file named sample.enviroment.plist. This file is used by Xcode to set the following environment variables for linking purposes:

- ARUSPIX_IMLIB: Location of IM library.
- ARUSPIX_TORCH: Location of Torch library.
- ARUSPIX_MEI: Location of libmei framework.
- ARUSPIX_GTEST: Location of gtest framework.
- ARUSPIX_WX: Location of wxWidgets library.
- ARUSPIX_WX_VERSION: wxWidgets library version number.

environment.plist prototype:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
    <key>ARUSPIX_IMLIB</key>
    <string>/Users/puginl/libs/imlib</string>
    <key>ARUSPIX_TORCH</key>
    <string>/Users/puginl/libs/Torch3</string>
<key>ARUSPIX_MEI</key>
<string>/Users/jamie/ax-libs/osx</string>
<key>ARUSPIX_GTEST</key>
<string>/Users/jamie/ax-libs/osx</string>
    <key>ARUSPIX_WX</key>
    <string>/Users/puginl/libs/wx2.8.7</string>
    <key>ARUSPIX_WX_VERSION</key>
    <string>2.8</string>
</dict>
</plist>
```

1. You must modify the paths within this file to match your directory structure and rename it environment.plist.
2. In your home directory create the following hidden directory: .MacOSX.
3. Now copy the modified environment.plist file into the .MacOSX directory.
4. You must now log out and log back in.

3.3 Google test framework

Unit tests are written using googletest (<http://code.google.com/p/googletest/>). Download a copy and build it in Xcode (using `xcode/gtest.xcodeproj`). You will end up with a `gtest.framework` folder in the build directory. Copy this somewhere (such as the same directory as your checked out copy of aruspix).

Open up the aruspix project and find `gtest.framework` entry in the sidebar. Right click on it and choose Add \hookrightarrow Existing framework. Then select Add other... and choose the framework folder.

Run tests by compiling the `ax_test` target. Run it from a terminal or the xcode console. If you get a "Library not loaded" error, you need to set the framework path for the executable. Make 'ax_test' active and choose Project \hookrightarrow Edit Active Executable. In the arguments tab, set a variable `DYLD_FRAMEWORK_PATH` to `../../../../`. This is the path from the `ax_test` binary (in `aruspix/build/Debug`) to the `gtest.framework` folder.

3.4 libmei

Do the same as gtest with libmei (copy the framework somewhere, add existing framework, change `DYLD_FRAMEWORK_PATH` to the path of the framework).

3.5 Compilation of Machine Learning Executables used by Aruspix

1. Open `aruspix/osx/torch.xcodeproj` with Xcode.
2. Compile the following executables in both release and debug mode: `adapt`, `decoder`, `ngram`.

3.6 Compilation of Aruspix

Open `aruspix/osx/aruspix.xcodeproj` with Xcode. Aruspix should be ready to be compiled in both Debug and Release mode.

4 Linux Set Up

4.1 Dependencies

```
sudo apt-get install libtorch3-dev libwxgtk2.8-dev wx-common libimlib2-dev libxml2-dev cmake
```

IMlib is available from <http://www.tecgraf.puc-rio.br/im/>

4.2 Compilation

```
mkdir build
cd build
cmake ../linux
make
```

5 Aruspix Source Code Organization

This file describe the source code organization of the project, with the directory tree. A first group of directories contains files that are common to the application, as the other directories are specific to the different workspace environment. Every workspace environment is contained into a single directory that can be excluded from the application by changing the preprocessor definitions.

5.1 Common files

`/app` : This directory contains the files that constitute the core of the application. The are prefixed with "ax". Most of the a related to GUI classes.

`/im` : This directory contains the files related to image processing. Classes and function that extend some functionalities of the IMLIB image processing library, such as advanced binarization methods, are to be find here.

`/ml` : This directory contains the files that relate to machine learning.

`/mus` : This directory contains the files that implement the music editor and handle the music files.

5.2 Workspace environment files

Workspace environments can be enabled or disabled at compilation by changing preprocessor definitions. The files generated with wxDesigner cannot be disabled by changing the preprocessor definitions and have to be removed by hand (this has to be fixed).

`/empty` : This directory contains a workspace template (May be out of date).

/superimposition : This directory contains the files that implement the superimposition of digital music on to the original images.

/recognition : This directory contains the files that deal with the music recognition.

/comparison :
